

MLEO — Whitepaper

GameFi Ecosystem • Vault Economy • Tokenomics • Staking • Governance

Executive Summary

MLEO is a Web3 GameFi ecosystem built around a sustainable closed-loop token economy: Play → Earn → Spend → Claim (Gradually). Players mine and earn MLEO in Mining titles and Arcade Online, store rewards in a unified Vault, and claim or stake under transparent smart-contract rules. The goal is long-term engagement, deflation-aware emissions, and community-driven growth.

Ecosystem Overview

- Mining: Token Rush, Space Mining Station — Proof-of-Play mining with on-chain accountability.
- Arcade Online: Roulette MP, Blackjack MP, Poker MP, Ladder, Diamonds, War — spend and win using the same token.
- Vault: Unified balance that aggregates mining and arcade winnings; connected to Claim and Staking contracts.
- Staking: Dynamic, Fixed-1Y, Fixed-3Y, Flex models to reward long-term participation.
- Infrastructure: Next.js + Supabase; BNB Smart Chain (Testnet → Mainnet).

Token Utility

MLEO powers the entire platform: marketplace currency, entry fees, upgrades, tournament rewards, and staking. Spending inside the ecosystem may include small burn fees to counter emissions and align incentives.

Vault & Claim System

All earnings are recorded in a per-user Vault for performance and UX. After launch, claims are partially unlocked per cycle to avoid oversupply and encourage continued participation. Tiered claim limits (10% / 25% / 50% / 100%) and time-based unlocks can be adjusted through governance parameters.

Tokenomics

Total Supply: 18,000,000,000,000 (18T)

- Presale — 30%
- Gaming & Mining — 20%
- Staking — 10%
- Marketing & Partnerships — 20%
- Team & Development — 10%
- Treasury / Community / Burn — 10%

Presale & Launch

Multi-stage presale with increasing price tiers. Partial auto-claim at TGE, followed by controlled releases. Launch plan: DEX liquidity on BNB Mainnet, analytics dashboard, and phased opening to mitigate bots and MEV.

Staking

Dynamic APY responds to treasury health, participation, and network activity. Fixed-term pools (1Y/3Y) and Flex provide choices for risk horizons and help reduce circulating supply.

Governance & Community

Start with DAO-Lite (off-chain proposals and public voting) and progressively enable on-chain governance. Eligibility via token/stake thresholds and anti-sybil protections. Community votes guide reward calibration, treasury grants, events, and feature priorities.

Architecture & Security

Frontend: Next.js (responsive, PWA). Backend: Supabase (Auth, RLS, real-time; scheduled jobs via pg_cron). Smart Contracts: Token, Presale, Claim Controller, Staking Pools — with role separation, time-locks, pausability, and audits.

Roadmap

Phase 1 — Testnet: finalize multiplayer games and Vault logic; security reviews; public testing.

Phase 2 — Mainnet: deploy token, claim controller, staking; seed DEX liquidity; analytics go-live.

Phase 3 — Expansion: new arcade titles, tournaments, NFT cosmetics & marketplace pilot; DAO-Lite voting.

Phase 4 — Scale & L2: evaluate sidechain/rollup, bridge design, strategic listings.

Legal & Contact

Informational only; not financial, legal, or tax advice. Ownership of MLEO does not represent equity or claims on assets. Participation may be limited by jurisdiction.
